The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least on target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous
                                                                                                                                                                                                                                                                                                                                                                                                                  Glassman

The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 2X ELVISLIVES complementary repeat region DN found in plasmid pKS133 used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC The present invention relates to diverged delta-9 fatty acid desaturase CC proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular CC lipids, including oil, in tissues when the enzyme is absent or rate-CC limiting, to isolate cDNAs and genes encoding homologous proteins from CC the same or other plant species and to create transgenic plants in which CC the polypeptides are present at higher or lower levels than normal or in CC cell types or developmental stages in which they are not normally found, CC thus altering the level of mono-, poly- and unsaturated fatty acids in CC those cells. They are useful as probes for genetic and physical gene CC (RFLP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmid pKS133 CC This sequence is used in the exemplification of the invention for the Suppression of Fad2 in sowhear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                             Ş
                                                                                                                                                                                                          cc proteins and polynucleotides encoding such proteins. The nucleic acid components and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular cc limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in ccl types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism complimed as protein fragment length polymorphism complimed in the peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is a sequence is used in the exemplification of the invention for the suppression of Fad2 in soybean

The invention relates to decreasing the ratio of liquiritigenin-derived isoflavones relative to the total isoflavones in an isoflavonoid-producing plant comprising transforming a plant cell with a recombinant construct comprising a promoter operably linked to a nucleic acid sequence of at least 200 nucleotides having at least 75% sequence identity to ADQ07965 (a soybean chalcone reductase cDNA). Also included are an isoflavonoid-producing plant made by the method above, seeds or plant parts of the plant, an isoflavonoid-containing protein product the total isoflavone levels obtained from the seeds or plant parts, a food (or a nutritional supplement, a food bar, or a beverage) which has incorporated the isoflavonoid-containing product, and a method of producing an isoflavonoid-containing product, and a method of liquiritigenin-derived isoflavone relative to the total isoflavone levels. The recombinant construct comprises a stem-loop structure and the nucleic acid sequence forms a loop in the stem-loop structure and the stem comprises a sequence of aDQ07968). The promoter is a seed-specific promoter. The method is useful for decreasing the ratio of liquiritigenin calculative to the total isoflavones in an isoflavone-conducing plant. The methods and recombinant construct are useful in producing an isoflavonoid-containing product.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       their related nucleic acids. The sequences are useful for producing a CC transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. CC phosphoglucomutase activity. An isolated polynucleotide that affects the cc phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a cc plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polynucleotide, and comparing the level of the polypeptide with the level of the polypeptide in the polypeptide in a plant cell that does not contain the collated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comparises consisted polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered comparisor of plastidic phosphoglucomutase. This sequence represents an convention of altered convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a common transferming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of compression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polynucleotide, and comparing the level of the polypeptide in the polypeptide in the plant cell containing the isolated polynucleotide with the isolated polynucleotide. The isolated polynucleotide with the level of the polypeptide in a plant cell that does not contain the isolated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transformed cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered convention of plastidic phosphoglucomutase. This sequence represents an convention in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least on target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 1% ELVISLIVES complementary repeat region D found in plasmids pKS106 and pKS124 used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Glassman

                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the sequences and their reverse genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmids pKS106 and pKS124 used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant construct having a promoter operably sequence which when expressed produces an RNA having mRNA and its reverse complement unrelated to endogency gene expression.

                                                                                                                                                                                                                                                                                                                                     proteins and polynucleotides encoding such proteins. The nucleic acid controls are proteins and polynucleotides encoding such proteins. The nucleic acid controls are may be used to increase the level of unsaturation in cellular controls, including oil, in tissues when the enzyme is absent or rate.

CC limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene capping and as markers, e.g. restriction fragment length polymorphism companies specific for the peptides can be used to immunise animals to produce is 1x ELVISLIVES complementary repeat region DNA found in plasmids pXS106 and pXS124. This sequence is used in the exemplification of the invention controls of the invention of the suppression of Fad2 in soybean

                                                                                                                                                                              The present invention relates to diverged delta-9 fatty acid c proteins and polynucleotides encoding such proteins. The nucleotides may be used to increase the level of unsaturation continuiting, including oil, in tissues when the enzyme is absented in intiting, to isolate cDNAs and genes encoding homologous protect the same or other plant species and to create transgenic plant could the polypeptides are present at higher or lower levels than increase the polypeptides are present at higher or lower levels than it is polyes or developmental stages in which they are not now thus altering the level of mono-, poly- and unsaturated fatt; those cells. They are useful as probes for genetic and physic mapping and as markers, e.g. restriction fragment length polic (RFLP) markers. The peptides can be used to immunise animals antibodies specific for the peptides and proteins. The present is 1x ELVISLIVES complementary repeat region DNA found in place and pks124. This sequence is used in the exemplification of for the suppression of Fad2 in soybean
                                                                                                                                                                                                                                                                                                                                                                                                                                      New delta-9 fatty acid desaturase polypeptides and polynuseful in creating transgenic plants having altered level - and unsaturated fatty acids and in increasing the unsatin cellular lipids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key
                                                                                                                                                         Sequence

                                                                                                                                                                                         밁
                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                        The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a contranspenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of compression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the level of the polypeptide in a plant cell containing the level of the level of the polypeptide in a plant cell that does not contain the collated polynucleotide. An a plant cell that does not contain the lastidic phosphoglucomutase protein in a host cell comprises cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered collavels of plastidic phosphoglucomutase. This sequence represents an artificial DNA used for plasmid construction, in the methods of the
                                                                                                                                  문
                                                                                                                                                                                                                                                            Query Match

                                                                                ঠ
                                                                                                                                                                         CC The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant cell with a polynucleotide of colynucleotide fragments are useful for suppressing the level of expression of a gene encoding a plant for suppressing the level of compression of a plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the isolated polynucleotide with the level of the polypeptide in a plant cell that does not contain the collated polynucleotide. A method for altering the level of expression of the plastidic phosphoglucomutase protein in a host cell comprises cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered collevels of plastidic phosphoglucomutase. This sequence represents an convention in the methods of the invention in the methods of the chimeric convention.

                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is a PCR primer used for amplifying ELVISLIVES complementary region DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glassman

                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is a PCR primer used for amplifying ELVISLIVES complementary region DNA used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                               뭉
                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic posphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the polypeptide in the plant cell containing the level of the polypeptide with the level of the polypeptide in a plant cell that does not contain the collated polynucleotide. A method for altering the level of expression of the plastidic phosphoglucomutase protein in a host cell comprises can plastidic phosphoglucomutase protein in a host cell comprises transformed cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered levels of plastidic phosphoglucomutase. This sequence represents an convention in the methods of the
                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to plastidic phosphoglucomutase polypeptides and CC their related nucleic acids. The sequences are useful for producing a CC transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of CC Polynucleotide fragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic phosphoglucomutase polypeptide in a CC level of expression of a plastidic phosphoglucomutase polypeptide in a CC least 541 nucleotides, measuring the level of the polypeptide in the CC plant cell containing the polynucleotide, and comparing the level of the level of the polypeptide in a plant cell that does not contain the CC polypeptide in the plant cell containing the level of the level of the polypeptide in a plant cell that does not contain the CC isolated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises CC a plastidic phosphoglucomutase protein in a host cell comprises CC cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered CC levels of plastidic phosphoglucomutase. This sequence represents an CC invention

                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences for the human brain T calcium channel alpha 1G and alpha 1I subunits. The alpha 1G subunit gene (designated CACNAIG) consists of 38 exons, and alternative processing leads to the production of 64 different proteins. The alpha 1I subunit (designated CACNAII) consists of 37 exons, and 8 proteins are produced due to alternative processing. The sequences provided by the invention are useful for screening drugs for use in the treatment of epilepsy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              र्
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cc polynucleotides (cdps) from the corn (Zea mays) cDNA libraries SATMON022

Cc and SATMON023. Some of the cpds uniquely identify structural, functional, and regulatory genes of corn ear. The polynucleotides sequences are cc useful for detecting cpds in a sample, for producing a corn ear-specific profile of gene transcription, for detecting altered gene expression in cc inbred or hybrid plants, and for screening several molecules for specific binding to the polynucleotide. The cdps are useful to identify, isolate, or extend identical or related corn-ear nucleic acid sequences from DNA libraries, and in nucleic acid amplification or hybridisation techniques to follow the expression of desirable traits through plant breeding cc programs. Preferably, the cdps are used to identify, evaluate, alter, or follow the inheritance of desired characteristics associated with growth cand development, disease resistance, environmental adaptability, quality, cand yield of corn. The cdps are also useful as molecular markers for studying inheritance and multigene traits in a plant breeding program. The cdps are also useful in diagnostic assays to compare the corn and techniques. They are also useful in diagnostic assays to corn confirm conditions or diseases associated with abnormal levels of cdp expression. ABX81541-ABX89140 represent corn ear-derived cornected of cornat directly from the USPTO web site at

                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to the isolation of corn ear-derived polynucleotides (cdps) from the corn (Zea mays) cDNA libraries SATMON022 cand SATMON023. Some of the cpds uniquely identify structural, functional, and regulatory genes of corn ear. The polynucleotides sequences are useful for detecting cpds in a sample, for producing a corn ear-specific profile of gene transcription, for detecting altered gene expression in cinbred or hybrid plants, and for screening several molecules for specific binding to the polynucleotide. The cdps are useful to identify, isolate, or extend identical or related corn-ear nucleic acid sequences from DNA libraries, and in nucleic acid amplification or hybridisation techniques to follow the expression of desirable traits through plant breeding programs. Preferably, the cdps are used to identify, evaluate, alter, or follow the inheritance of desirable traits through plant breeding studying inheritance of desirade characteristics associated with growth and yield of corn. The cdps are also useful as molecular markers for the cpds are useful for producing purified corn-ear polypeptides by recombinant techniques. They are also useful in diagnostic assays to of cdp expression. ABX81541-ABX81440 represent corn ear-derived polynucleotides (cpds) of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a human glutamate receptor delta-1 subunit polypeptide. This can be used to screen for agents which modulate the activity of glutamate receptor delta-1 subunit polypeptide, which may then be used in the treatment of diseases such as epilepsy, brain damage, neurodegenerative disorders such as Alzheimer's disease, Huntington's disease and Parkinson's disease, schizophrenia, mood disorders, pain, neuropathologic pain and dementias. The present sequence is a fragment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human glutamate receptor delta-1 subunit protein which can regulated for treating epilepsy, schizophrenia, neurodegenerative diseases, ischemia, pain, benign prostate hyperplasia and urinary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a human glutamate receptor delta-1 subunit polypeptide. This can be used to screen for agents which modulate the activity of glutamate receptor delta-1 subunit polypeptide, which may then be used in the treatment of diseases such as epilepsy, brain damage, neurodegenerative disorders such as Alzheimer's disease, Huntington's disease and Parkinson's disease, schizophrenia, mood disorders, pain, neuropathologic pain and dementias. The present sequence is a fragment of the human glutamate receptor delta-1 subunit coding sequence
                                                      Novel human glutamate receptor delta-l subunit protein which can legulated for treating epilepsy, schizophrenia, neurodegenerative diseases, ischemia, pain, beniqn prostate humaniania

                     The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polypeptide. This can be used to screen for agents which modula activity of glutamate receptor delta-1 subunit polypeptide, whithen be used in the treatment of diseases such as epilepsy, braneurodegenerative disorders such as Alzheimer's disease, Huntin disease and Parkinson's disease, schizophrenia, mood disorders, neuropathologic pain and dementias. The present sequence is a function the human glutamate receptor delta-1 subunit coding sequence
                                                                                                                                                                                                                                          New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo

                                                                                                                                                           identified within the present sequence. The 5' ESTs were prepared from CC total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA CC libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' CC ESTs are derived from mRNAs with intact 5' ends and can therefore be used in obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in CC diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
